## INTRODUCTION

This is the fifth issue of the publication on **Fertilizer Use by Crop** produced jointly by the Food and Agriculture Organization of the United Nations (FAO), the International Fertilizer Industry Association (IFA), the International Fertilizer Development Centre (IFDC), the Phosphate and Potash Institute (PPI) and the International Potash Institute (IPI). This issue is the first published by five organizations since 1992. This publication will be released as usual after every alternate year.

The report generates a large amount of interest because of a lack of published information on application rates and use of fertilizer by crop type. The information in this report is useful to agricultural researchers, fertilizer marketing managers, international agencies, policy makers and various government agencies. It is also very useful for the analysis of environment-related issues such as input-output balances of plant nutrients in soils. The positive response to the four previous reports indicated that there was considerable need for this type of information.

The data on fertilizer use by crop contained in this publication relate to the year 1995 onward. For improvement of geographical coverage and data quality FAO, IFA, IFDC, IPI and PPI agreed to collaborate and broaden the scope of this study for issuance of this joint publication.

The sources of data in the publication are the following:

1. FAO questionnaires sent to member countries;
2. IFA questionnaires sent mainly to industry company members, research and development institutes and national and regional fertilizer associations and institutes.
3. IFDC questionnaires sent to agronomists, economists and other participants in various fertilizer training courses, professional meetings and other seminars conducted by IFDC;
4. IPI and PPI special contacts with specialized experts.

These organizations held meetings in Paris in September and December 2001 to review the data for the fifth publication. The published FAO statistics on country-wise total fertilizer consumption and crop areas were helpful and, in many cases, used as a guide to determine the reliability of the response. The data shown in this publication represent the consensus of the group. It is suggested that these data should be taken as to reflect the general magnitude rather than an exact measurement.

In this report attempt has been made to present data that make it clear whether application rates are the average for the entire crop area (fertilized and unfertilized) or the average for the area that is fertilized. Since data are estimated differently by various countries, it is not possible to adopt a uniform presentation for all countries and to provide a comprehensive global view. In a few countries where updates were not available, data from previous reports were included. The main characteristics of these data are given below to facilitate their interpretation:

1. Only a very limited number of countries have government agencies that collect such data. In many cases coverage is restricted to a few major crops;
2. Not all countries report data for the same year;
3. Mixed-cropping is practised in many countries, which makes it difficult to quantify the amount used on each crop. Some countries made estimates for a group of crops (i.e., cereals) rather than individual crops such as wheat and barley;
4. In some of the countries, the same area is sown more than once (double-cropping). In such cases, most or all of the fertilizer is applied to one crop, but the fertilizer benefits both the crops. In the present FAOSTAT database the use of fertilizer has been associated with crop to which it has been applied.

Further, in order to have a better understanding of **the total quantity of fertilizers** consumed in each country, the estimates of the N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O consumption made by FAO/World Bank/UNIDO/Industry Working Group on Fertilizers are included. The sum of fertilizer use for all crops for a given country may be different from the estimates made independently by the Working Group as the former relates to selected crops while the later refers to consumption.

This publication presents data for 88 countries on fertilizer use by crop types expressed in plant nutrients for nitrogen (N), phosphate (P<sub>2</sub>O<sub>5</sub>) and potash (K<sub>2</sub>O). Data on the application rates, total cultivated area, percentage of area fertilized and total consumption by individual crop are also shown.

FAO, IFA, IFDC, IPI and PPI gratefully acknowledge the assistance of all those who contributed to this publication and welcome suggestions from readers for further development and improvement. The group would also like to take this opportunity to

thank Dr Kim Gai Soh of IFA for his dedicated and valuable contribution to this work for a long period.

## DEFINITIONS USED IN THE TABLES

**TOTAL AREA (1000 ha)** refers to land cultivated with the crop listed only.

**PERCENTAGE AREA FERTILIZED (% Fert.)** refers to the proportion of total area under a certain crop receiving fertilizers.

**RATE (kg/ha)** refers to the amount of fertilizers applied to one hectare of a crop during a season (application rate).

**AVERAGE (Aver. kg/ha)** refers to national average application for the relevant crops.

**CONSUMPTION (1000 Metric tons)** refers to the amount of nutrient used on individual crop. The total fertilizer consumption for a given country was obtained by summing up quantities used on the crops listed only and will, therefore, differ from the total country' fertilizer use as shown in the FAO Fertilizer Yearbook.

Figures may not always add up to the totals given due to rounding.

## INTRODUCTION

Cette cinquième édition de l'**Utilisation des engrais par culture** est publiée conjointement par l'Organisation des Nations Unies pour l'alimentation et l'agriculture (FAO), l'Association internationale de l'industrie des engrais (IFA), le Centre international de développement des engrais (IFDC), l'Institut international des engrais potassiques (IPI) et L'Institut pour les engrais phosphatés et potassiques (PPI). C'est la première édition publiée conjointement par les cinq organisations depuis 1992. Les prochaines éditions seront publiées, comme de coutume, chaque deux ans.

L'intérêt croissant rencontré par cette publication est dû, en partie, au manque de matériel publié sur le taux d'application et sur l'utilisation des engrais par culture. Les informations bénéficient aux chercheurs agricoles, aux agents commerciaux, aux agences internationales, aux décideurs politiques et, surtout, aux pays eux-mêmes. Elles sont aussi utiles par rapport aux débats concernant l'environnement, tels que les bilans apport-bénéfice d'éléments nutritifs dans les sols. L'accueil favorable rencontré par cette publication a montré le besoin de fournir ce type d'informations

Dans cette publication, les données sur l'utilisation des engrais par culture se réfèrent à la période à partir de 1995. Afin d'assurer une couverture complète et d'améliorer la qualité des données, la FAO, l'IFA, l'IFDC, l'IPI et le PPI ont accepté de collaborer pour élargir le champ de cette étude et publier un document commun. Les données ont été compilées à partir des informations obtenues auprès des sources suivantes :

1. Le questionnaire de la FAO, envoyé aux pays membres;
2. Le questionnaire de l'IFA, envoyé principalement à ses membres de l'industrie des engrais, aux instituts de recherche et aux associations nationales et régionales sur les engrais;
3. Le questionnaire de l'IFDC, envoyé aux agronomes, aux économistes et aux participants de diverses sessions de formation dans le domaine des engrais, aux congrès professionnels, et autres séminaires organisés par l'IFDC;
4. Les contacts de l'IPI et PPI avec des experts spécialisés.

Ces cinq organisations se sont réunies à Paris en septembre et décembre 2001 pour examiner et analyser les données reçues afin de les trier pour les publier. Les statistiques de la FAO déjà disponibles sur la consommation totale des engrais par pays et sur les superficies des cultures ont été considérées très utiles, et dans un certain nombre de cas ont servi de mesure sur la qualité des réponses reçues. Les données choisies représentent un consensus du groupe de travail. Ces données devraient être prises comme telles pour fournir une estimation générale plutôt qu'une mesure exacte.

Dans ce rapport, nous avons essayé de présenter les tableaux d'une manière claire et concise en indiquant si les taux d'application utilisés sont la moyenne de l'ensemble de la superficie cultivée (fertilisée ou non fertilisée) ou bien uniquement la

moyenne de la superficie qui est fertilisée. Puisque les données sont estimées différemment par les divers pays, il n'est pas possible d'adopter une présentation uniforme pour tous les pays et de fournir un aperçu global détaillé. Pour un nombre restreint de pays, où il n'était pas possible de mettre à jour les données, nous nous sommes référés aux rapports précédents pour obtenir une vue d'ensemble plus complète. Les principales caractéristiques de ces données sont mentionnées ci-dessous pour en faciliter leur interprétation:

1. Pour l'instant, seul un nombre limité d'agences gouvernementales compilent de telles données. Leurs couvertures se limitent souvent à quelques cultures principales;
2. Certains pays n'ont pas fourni des données pour l'année de référence;
3. La technique de plusieurs cultures par an se pratique dans quelques pays rendant difficile la quantification des engrais utilisés par récolte. En outre, certains pays fournissent des estimations plutôt par groupes de récoltes (par exemple, les céréales) que par récolte individuelle (blé et orge);
4. Dans certains pays la même superficie est semée plusieurs fois (technique de la double récolte annuelle). Dans ce cas-ci la plupart ou la totalité des engrais est appliquée à une seule récolte mais bénéficie à toutes les deux. Dans le FAOSTAT, la base de données de la FAO, l'engrais est présenté en l'associant à la culture à laquelle il a été appliqué.

De plus, par souci de clarté concernant la quantité d'engrais consommée par chaque pays, nous avons inclus ici l'estimation de la consommation totale de N,  $P_2O_5$ ,  $K_2O$  faite par la FAO/Banque Mondiale/ONUDI/Groupe de travail de l'industrie sur l'engrais. La quantité d'engrais utilisée pour l'ensemble des cultures, dans un pays déterminé, peut être différente de l'estimation faite de manière indépendante par le Groupe de travail. En effet la première peut se rapporter uniquement aux cultures sélectionnées, tandis que l'autre se réfère à la consommation totale.

Ce document présente les données de 88 pays sur l'utilisation des engrais par culture exprimées en terme d'éléments nutritifs pour l'azote (N), le phosphate ( $P_2O_5$ ) et la potasse ( $K_2O$ ). On y montre aussi les données sur les taux d'application, la surface totale récoltée, le pourcentage des superficies fertilisées et le total de la consommation par culture.

La FAO, l'IFA, l'IFDC, l'IPI et le PPI remercient vivement de leur collaboration tous ceux qui ont contribué à la publication de ce document et restent ouverts à toute suggestion de la part des lecteurs. Le groupe de travail aimerait, par la même occasion, exprimer ses remerciements les plus sincères au docteur Kim Gai Soh de l'IFA pour sa longue et importante contribution à ce travail.

## DEFINITIONS UTILISÉES DANS LES TABLEAUX

***SUPERFICIE TOTALE (1000 ha)***, représente la superficie des terres cultivées seulement pour la culture en question.

***POURCENTAGE DES TERRES FERTILISÉES (% Fert.)***, indique la proportion des terres enrichies par des engrais dans la superficie totale qui est consacrée à une culture donnée.

***TAUX (kg/ha)***, se rapporte à la quantité d'engrais utilisée sur un hectare pour une culture (taux d'application).

***MOYENNE (kg/ha)***, se réfère à la moyenne nationale du taux d'application pour les cultures en question.

***CONSOMMATION (1000 Tonnes métriques)***, représente la quantité d'éléments nutritifs utilisés pour chaque culture. La consommation totale d'engrais pour un pays donné est obtenue en totalisant les quantités utilisées pour les cultures recensées et peut donc différer du total donné dans l'Annuaire des engrais de la FAO.

Les totaux qui figurent dans les tableaux ne correspondent pas toujours à la somme exacte de leurs éléments; ceci est dû au fait de l'arrondissement des montants individuels.

## INTRODUCCIÓN

Esta es la quinta edición de ***Utilización de fertilizantes por cultivo***, publicada conjuntamente por la Organización de las Naciones Unidas para la Agricultura y la Alimentación (FAO), la Asociación Internacional de Industrias de Fertilizantes (IFA), el Centro Internacional para el Desarrollo de los Fertilizantes (IFDC), el Instituto Internacional de los Fertilizantes Potásicos (IPI) y el Instituto de Fertilizantes Fosfatados y Potásicos (PPI). Ésta es la primera edición publicada por cinco organizaciones desde 1992. Esta publicación será publicada como de costumbre cada dos años.

Este documento ha sido acogido favorablemente debido a la falta de información publicada sobre tasas de aplicación y uso total de fertilizantes por cultivo. Este tipo de información es muy útil para los investigadores agrícolas de fertilizantes, las organizaciones internacionales y, en primer lugar, para los países mismos. Resulta útil también cuando se trata de analizar los problemas del medio ambiente como, por ejemplo, el efecto de los residuos de los nutrientes para cultivos en el terreno (balance insumo-producto). La acogida favorable a los primeros cuatro documentos es una indicación de la gran necesidad que existe por este tipo de información.

Los datos sobre la utilización de fertilizantes por cultivo de esta publicación se refieren al año 1995 hacia adelante. Por consiguiente, la publicación contiene los datos del último año disponible para cada uno de los países cubiertos por la encuesta. A fin de aumentar la amplitud del estudio y evitar discrepancias entre los datos, la FAO, la IFA, el IFDC, el IPI y el PPI acordaron colaborar y publicar un trabajo conjunto. Por otra parte intentaron mejorar la calidad de los datos que se recibieron de encuestas incluyendo otras fuentes.

Las fuentes principales de los datos en esta publicación son las siguientes:

1. El cuestionario de la FAO enviado a los países miembros;
2. El cuestionario de la IFA enviado principalmente a las industrias pertenecientes a esta Asociación, a los institutos de investigación y del gobierno y a las asociaciones nacionales y regionales de los fertilizantes.
3. El cuestionario del IFDC enviado a sus contactos distribuidos en todo el mundo, incluyendo agrónomos, economistas y otros participantes a cursos de capacitación sobre el uso de fertilizantes, congresos profesionales y otros seminarios organizados por el IFDC;
4. Los contactos que el PPI y el IPI mantienen con los expertos especializados.

Estas cinco organizaciones acordaron en una reunión conjunta en septiembre y diciembre del 2001 examinar las informaciones recibidas y publicarlas en esta quinta edición. Las estadísticas publicadas por la FAO sobre el consumo total de fertilizantes y las superficies de cosecha fueron útiles para la confiabilidad del

trabajo y, en muchos casos, se usaron como guía principal para determinar las estimaciones.

Los datos publicados en este documento indican una aproximación de la utilización de fertilizantes en cada país y fueron obtenidos por consenso del grupo. Estos deben ser utilizados para reflejar una aproximación y no una medida exacta de la utilización de fertilizantes por país.

En este documento, se ha intentado presentar datos que indiquen con claridad cuando las tasas de aplicación corresponden al promedio del área total de cultivo (con o sin fertilizantes) o cuando las tasas de aplicación corresponden al promedio del área con fertilizantes. Como los criterios de estimación difieren de un país a otro, no ha sido posible adoptar una presentación de las estadísticas uniforme para todos los países y proveer un amplio panorama general. En algunos países, donde no existen resultados recientes, se han utilizado datos de las publicaciones previas para proveer un panorama más detallado. Las características principales de estos datos se dan a continuación para facilitar su interpretación:

1. Solamente algunos pocos países han recolectado este tipo de datos. En la mayoría de los casos, la cobertura se limita a algunos cultivos principales;
2. no todos los países presentan datos sobre la utilización de fertilizantes para el mismo año;
3. la técnica de varias cosechas anuales se practica en varios países, lo que dificulta la determinación de la cantidad de fertilizantes utilizada para cada cultivo. Además, algunos países producen una estimación para un grupo de cultivos (por ej., cereales) y no para cada cultivo individualmente (trigo y cebada);
4. la técnica de la doble cosecha se practica en varios países. En muchos casos, la mayoría o la totalidad de los fertilizantes se aplica a una sola cosecha, pero los fertilizantes benefician a las dos.

Además, para entender mejor la cantidad de fertilizantes utilizados por país, se incluyen las estimaciones de la utilización de N,  $P_2O_5$  y  $K_2O$ , producidas por la FAO/Banco Mundial/UNIDO/Grupo de Trabajo de Industrias de fertilizantes. La suma del uso de fertilizantes para todos los cultivos en un país dado, puede ser diferente de la estimación obtenida independientemente por el Grupo de Trabajo. Esto es debido a que las cifras de países se refieren a algunos cultivos, mientras que las estimaciones del Grupo de Trabajo se refieren al consumo total.

Esta publicación muestra los datos para 88 países sobre la utilización de fertilizantes en los cultivos, expresados en nutrientes de las plantas en forma de Nitrógeno (N), Fosfatos ( $P_2O_5$ ) y Potasa ( $K_2O$ ); también muestra los datos sobre tasas de aplicación, superficie total cultivada, porcentaje de tierra fertilizada y consumo total de fertilizantes para cada producto.

La FAO, la IFA, el IFDC, el IPI y el PPI desean agradecer a todos los que han colaborado en la elaboración de este documento, cuyo alcance y calidad esperan ampliar y mejorar en el futuro. Se agradecerá también cualquiera sugerencia de los

lectores con ese propósito. El grupo de trabajo desea aprovechar la oportunidad para agradecer al Dr. Kim Gai Soh del IFA por su valiosa contribución al campo de utilización de fertilizantes por cultivo.

## DEFINICIONES EMPLEADAS EN LOS CUADROS

***SUPERFICIE TOTAL (1000 ha)***, la superficie dedicada a cada cultivo.

***PORCENTAJE DE SUPERFICIE FERTILIZADA (% Fert.)***, la parte de tierra cultivada bajo un cierto producto que ha sido, fertilizada.

***TASA (Rate kg/ha)***, la cantidad de fertilizante aplicada por hectárea cultivada (tasa de aplicación).

***PROMEDIO (Aver. Kg/ha)***, se refiere a la tasa de aplicación nacional promedio para los cultivos relevantes.

***CONSUMO (1000 Tonelada Métrica)***, la cantidad de nutriente para cada cultivo. El consumo total de fertilizantes en un cierto país ha sido obtenido sumando las cantidades empleadas para los productos listados y por eso puede ser diferente del total de fertilizantes empleados en cada país publicado en el Anuario FAO de Fertilizantes.

La suma de las cifras parciales no siempre corresponde a los totales debido a los procedimientos de redondeo.
